MuCool Test Area scope

➤ Design, prototype and bench test cooling-channel components :

- LH₂ absorber: low-Z absorber
- RF cavities: high accelerating gradient
- SC solenoid magnet: high focusing magnet

➤ Support cooling demonstration for MICE

- Dev.of intense ionization beam - 400 MeV beam up to 2.4×10^{14} p/s
- ~570 W in 35-cm LH₂ absorber

Cryogenics for ionization cooling...

1) H₂ liquefaction

Use Helium as a coolant:

➔ Install compressor and refrigeration system

2) SC Solenoid magnet

Use LHe and LN₂

LH₂ Absorber

➔ Convection type

➔ **Forced-flow type**

Ionization Cooling and LH2

Beam optic and emittance:

$$s_x = \sqrt{\frac{e_n b_x}{g}}$$

Energy Loss vs. Coulomb Scattering

Transverse cooling merit factor $F \propto (L_R dE/dx)^2$

$$\frac{de_n}{ds} = - \underbrace{\frac{1}{b^2} \frac{dE_m}{ds} \frac{e_n}{E_m}}_{\text{Ionization cooling}} + \underbrace{\frac{1}{b^3} \frac{b_{\perp}(0.014)^2}{2E_m m_m L_R}}_{\text{Bethe-Bloch multiple scattering}}$$

Ionization cooling

$$\frac{dE}{dx} a \frac{Z}{A}$$

$$\frac{1}{L_R} a Z^2$$

Bethe-Bloch
multiple scattering

Choice of LH2
and aluminum

Cryo-system characteristics

Item	Value	Unit
LH ₂ operating temperature	17	K
LH ₂ operating pressure	0.12	MPa
LH ₂ density	74.28	kg/m ³
H ₂ boiling point at 0.12 MPa	21	K
H ₂ freezing point at 0.12 MPa	14	K
LH ₂ viscosity	3.05	10 ⁻⁶ Pa-s
LH ₂ specific heat	7696	J/kg-K
Heat of vaporization	445.6	kJ/kg
LH ₂ thermal conductivity	97	mW/m-K
Liquid H ₂ volume ratio at 20 degree C	790	-

Item	Value	Unit
Volume of the LH ₂ loop	25	liter
Volume of the vacuum space	26,000	liter
Refrigeration capacity at 20 K	500	W
Refrigeration max mass flow	27	g/s
Refrigeration operating temperature	14	K
Refrigeration operating pressure	0.2	MPa

Simplified flow schematic:

Instrumentation and Monitoring

From Debbie Errede/ UIUC- absorber development and instrumentation (MTA absorber flow testing)

“The absorber will live in a hostile environment:

- The absorber will absorb 100-1000 Watts depending on beam intensity in cooling channel muon beam.
 - The MTA will provide a 400 MeV proton beam of $\sim 10^{13}$ protons/pulse @ 15 Hz to mimic the dE/dx deposition of a muon beam.
 - The absorber sits inside a solenoid of 4 Tesla (~ 1.5 T at absorber in cooling channel design)
 - The absorber is filled with liquid hydrogen thus operates at cryogenic temperature (14 –20K)
- THUS the monitoring devices must be rad-hard, and able to operate in high magnetic fields and cryogenic temps.”

Cryo-System instrumentation:

- ✓ **Goal:** 1) monitor and control operation 2) provide performance data 3) provide warming and/or alarm for out-of-limits conditions and 4) indicate a hazardous condition:
- ✓ **Type:** ~ 150 inst. : pressure transducer, temperature transducer (LS Cernox, Pt), LH2 level transducer (AMI), flow-meter, heater, excess flow valve, electro-pneumatic valves, certified safety relief valve, check valve
- ✓ ODH Detector, Flammable gas detectors
- ✓ **Selection:** NEC: Class I Division II Group B, range accuracy, response time

Physics: 36 cernox inside LH₂ absorber, more TBD

Alternative – SAMPLE cryo-loop

Characteristics:

- Close loop using 25 liters of LH_2
- Heat exchanger: 1 kg/sec LH_2 flow counterflow using copper hose and SS housing
dim : 85 cm, $\phi 15$ cm
- AC motor (10-60 Hz)
- Heater: 1 kW

christine darve – 02/14/05

Reference: E.J. Beise et al., A high power liquid hydrogen target for parity violation experiments, Research instruments & methods in physics research (1996), 383-391

Advantages:

1. Existing facility (safety, expertise)
2. Similar flow characteristics
3. Cost reduction
4. Design compatible with MTA proposal
5. Allow larger heat deposition

Hydrogen Safety

Risk:

- Hydrogen auto-ignition (hot points, etc.), Temperature 584 C

- Flammability limits for hydrogen are :

Air	Oxygen
U. 74.8%	U. 94.0%
L. 4.1%	L. 4.1%

- Detonation limits in Air: 18.3 - 59% hydrogen

(Lower pressure for ignition is ~1 psia; min abs. 0.02 psia or 1.4 mbar)

- Minimum spark energies for ignition of H₂ in air is 0.017 mJ at 1 atm, 300 K
Electrical sparks or static electricity (breaking electrical connections, nylon clothing, etc.)

25 liters of LH₂ released into the air and ignited with only a 10 % yield the energy equivalent to 4 kg of TNT

Practical set of Guidelines:

FERMILAB: “ Guidelines for the Design, Fabrication, Testing, Installation and Operation of LH₂ Targets – 20 May 1997” by Del Allspach et al. Fermilab RD_ESH_010– 20 May 1997

NASA: “ SAFETY STANDARD FOR HYDROGEN AND HYDROGEN SYSTEMS: Guidelines for Hydrogen System Design, Materials Selection, Operations, Storage, and Transportation”

FERMILAB

AD/Cryogenic Department

Fermilab Cryogenic Safety Reviews

The cryo-system was designed in accordance with :

- ◆ American Society of Mechanical Engineers (Boiler and Pressure Vessel Code, ...)
 - ◆ National Electrical Code (art. 500, etc.)
 - ◆ Fermilab Environment Safety & Health Code (Pressure vessel, vacuum vessel, piping, Oxygen Hazard Deficiency...)
 - ◆ Compressed Gas Associates
- + especially : Fermilab ES&H – 5032 (Hydrogen targets)
- = SAFETY + SAFETY + SAFETY

PROCESS:

Conceptual design (Audit: E158, G0, SAMPLE)

Internal (Cryo dept.) Engineering Review (24 sept. 2002)

Document generated for the forced flow cryo-system (no SAMPLE modification)
Report and calculations, Engineering notes, ODH analysis, FMEA, What-if-analysis,...

Status-quo

FERMILAB

AD/Cryogenic Department

Safety Document Check list

As per Fermilab's policy, test /operation using liquid hydrogen needs approval from LH₂ safety panel

Generate a Safety Review Book containing all of the required documents of Chapter 5032TA, including the following:

1. Structural calculations on all parts of the target
2. Venting calculations for the target
3. Venting calculations for the vacuum space
4. Venting calculations for the secondary containment
5. Complete drawings of the target, vacuum system and secondary containment
6. Instrument and valve summary
7. Interlock list
8. Operating procedures
9. Emergency procedures
10. Operational call-in list
11. Material certification data on part
12. FMEA, what-if-analysis
13. Flow diagram
14. Testing results

Electrical equipments located in the Experimental Hall shall be Class I Division II Group B or intrinsically safe when hydrogen is present.

- Inert gas purge boxes around electrical equipment and connections which are not properly classified.
 - Remove likely ignition sources and suspect unknown ignition sources
 - Prevent hydrogen leaks to air (sys. design, component testing, operational procedure)
 - Hydrogen systems should be kept at positive pressure
 - Material choice: Austenitic SS, Aluminum alloys, copper, Ti, PTFE, Kel-F...
-
- 25 liters of LH₂ can be contained at SPT in the vacuum buffer tank
 - Purge systems (operational procedures)
 - Equipment automatic control to reduce hazards
 - Fail-safe design
 - Redundant safety features, H₂ excess flow valve, over range
 - Safety PLC for process controls (QUADlog), interlock
 - Alarm/Warning signal system (malfunction of critical equipments, to initiate emergency procedure)

FERMILAB

AD/Cryogenic Department

Guiding principles for Hydrogen Design

- Preferred equipment: capacitance type, Output signal 4-20 mA
- Weld and VCR fitting are preferred to flange or other fitting
- Conduit, Power Limit Tray Cable and MC cables
- Detect accidental leaks (FG and ODH detectors)
- Fire and personnel protection
- Building ventilation requirement (fan and venting line)

The cost of the proposed design was estimated to ~ 60 k\$
(2002 – w/o SAMPLE cryo-loop)

Learned from KEK test: design, fabrication and operate (first test using LH₂ at MTA)

- Safety review process - Many months for cryo. dept. to design, fabricate, test, implement KEK equipment, and finally operate the first convection type LH₂ absorber run...
- Use existing building detectors (FG, ODH), FIRUS system
- Using existing safety PLC (QUADlog)
- Same hydrogen venting and vacuum buffer tank
- Similar operational procedures
- Same persons (review committee, cryo. department (?))
- Use of existing SAMPLE cryo-loop brings the advantage (as long as its operation doesn't present greater risk than that assumed when facility was originally designed)
- E158 example : at least 18 months of safety system design before the first use of liquid hydrogen. E158 safely operated for 8 months.

FERMILAB

AD/Cryogenic Department

Concluding Comments

- Development of MTA cryogenic system must be in compliance with Fermilab safety codes :
 - Helium safety panel (Helium cryo-plant and SC solenoid magnet)
 - Hydrogen safety panel (Forced-flow LH2 absorber cryo-system)
- MTA cryo-plant available :
 - Forced-flow cryostat heat exchanger: 27 g/s of helium @ 14 K, 15 psig (2 bar)
 - SC solenoid magnet: LHe (switch-over mode), LN2

Open questions:

- Operate LH₂ and SC solenoid magnet at MTA in accordance with LH₂ safety panel requirements
- Manpower
- Cost

FERMILAB

AD/Cryogenic Department

Concluding Comments

fact
Muon Collaboration

To-do-list to operate the forced-flow LH₂ absorber cryo-system:

➤ Helium cryo-plant :

- ✓ Installation and commissioning of the compressor room (Fermilab/Cryo dept. : piping contract in progress)
- ✓ Design, installation and test of transfer lines (Fermilab/PPD : in progress)
- ✓ Refrigeration system (Fermilab/Cryo. Dept.)

➤ Hydrogen system :

- ✓ Redesign forced-flow cryostat to implement the SAMPLE cryo-loop
- ✓ Complete numerical simulation to optimize the hydraulic system and LH₂ absorber body design (Oxford University)
- ✓ Generate safety review documents
- ✓ Engineering and hydrogen reviews
- ➔ Final documentation acceptance

➤ Operate the system
